## Power BI Business Intelligence Dashboard — Retail Sales Analysis

---

This report accompanies the Power BI dashboard (Norysca\_DataAnalytics\_Task5.pbix), built on a cleaned retail sales dataset modeled into a Fact (Orders) and Dimension (Customers, Products, Calendar) structure, with DAX measures driving every KPI card and visual. All figures below were read directly off the finished dashboard.

Dataset scope: 11,971 orders · 25 customers · Jan 2022 – Jan 2025 · Total Sales €1,552,071 · Average Order Value €129.65

# 1. Business Questions

## Q1

**Question:** Which category generates the most revenue?

**Dashboard/Analysis:** Sales by Category bar chart

**Finding:** Butchers leads at €208,118, followed closely by Electric Household Essentials (€203,814). Milk Products is lowest at €180,112 — only a 13.5% gap between the top and bottom category, so performance is evenly spread rather than concentrated in one category.

## Q2

**Question:** Which region performs best?

**Dashboard/Analysis:** Sales by Region pie chart

**Finding:** Central leads with €314,780 (20.28% of total sales); West trails at €304,927 (19.65%) — a gap of just 3.1%. All 5 regions sit within a narrow 4-point percentage band, meaning regional demand is essentially uniform across the business.

## Q3

**Question:** Who are the highest-value customers?

**Dashboard/Analysis:** Segment bar chart + underlying Customer table (not shown on main dashboard page)

**Finding:** The 'High Value' segment (top third of customers by spend) generates roughly €587,000 — notably more than the Medium or Low Value segments — despite representing only about a third of the 25-customer base.

## Q4

**Question:** What is the monthly sales trend?

**Dashboard/Analysis:** Total Sales by Month line chart

**Finding:** Sales opened strong in Jan 2022 (~€53K) before settling into a recurring up-down monthly pattern averaging roughly €40-45K, with no long-term upward or downward drift across the three-year window shown.

## Q5

**Question:** Which products are underperforming?

**Dashboard/Analysis:** Top 10 Products by Sales table

**Finding:** Aside from 'Unknown Item' (a data-quality placeholder from missing item names during cleaning, not a real product), the lowest of the top 10 named products is Item\_19\_Milk at €18,848 — roughly a quarter of the top named product (Item\_25\_Fur, €25,256). Products outside this top 10 list would need a dedicated bottom-10 view to identify true underperformers precisely.

---

## 2. Business Insights

### 3 Major Findings

1. Total revenue across the dashboard's full date range is €1,552,071 from 11,971 orders, at a consistent €129.65 average order value — a stable, high-volume transaction pattern with no extreme outliers skewing the average.
2. Category and regional performance are both remarkably even (13.5% and 3.1% spreads respectively) — this business does not have one standout category or region driving results, nor a single glaring weak spot.
3. The High Value customer segment contributes disproportionately more revenue than its share of the customer base would suggest, confirming that customer value, not raw customer count, is the more meaningful lever for revenue growth.

### 2 Important Trends

1. Monthly sales show a recurring saw-tooth pattern rather than steady growth or decline — performance oscillates between roughly €38K and €48K most months, suggesting a cyclical or order-timing effect rather than a genuine growth or decline trend.
2. January 2022 stands out as the single highest month on record (~€53K), notably above the recurring monthly band seen for the rest of the period — worth investigating whether this was a launch effect, a seasonal promotion, or a one-off data artifact.

### 3 Actionable Recommendations

1. Since High Value customers already drive a disproportionate share of revenue, build a loyalty or retention program specifically targeting this segment — losing even a few of these customers would have an outsized negative impact compared to losing an average Low Value customer.
2. Investigate what happened operationally in January 2022 to produce the highest month on record — if it was a repeatable promotion or launch tactic, it's a candidate to re-run; if it was a one-off, it shouldn't be used as a baseline for future target-setting.
3. Avoid concentrating marketing or inventory investment into a single 'top' category or region based on this data — with performance this evenly spread (both under a 15% top-to-bottom gap), a concentrated bet is more likely to cannibalize existing sales than capture meaningfully new revenue.
